ZoneZero® MFA

Improved and continuous user authentication is one of the main components in Zero Trust Network Access. Identification Providers and Multi-Factor Authentication providers have improved the authentication process, but the leading 'client-based' approach creates integration and maintenance challenges. Moreover, many non-web applications are not naturally compatible with MFA.

Safe-T's ZoneZero MFA centralized approach allows customers to easily integrate Multi-Factor Authentication and identity awareness into all access scenarios – remote and internal users, VPNs, web and non-web applications.

Features

+ Built-in MFA or integration with 3rd party MFA/IdPs
+ Support continuous authentication
+ Application access control policies for internal users
+ User > App and App > App use cases

Benefits

+ Centralized approach – no client side integration
+ Seamless integration – Rapid deployment
+ Upgrade 2FA to true MFA
+ Optimize cost of deployment and ownership
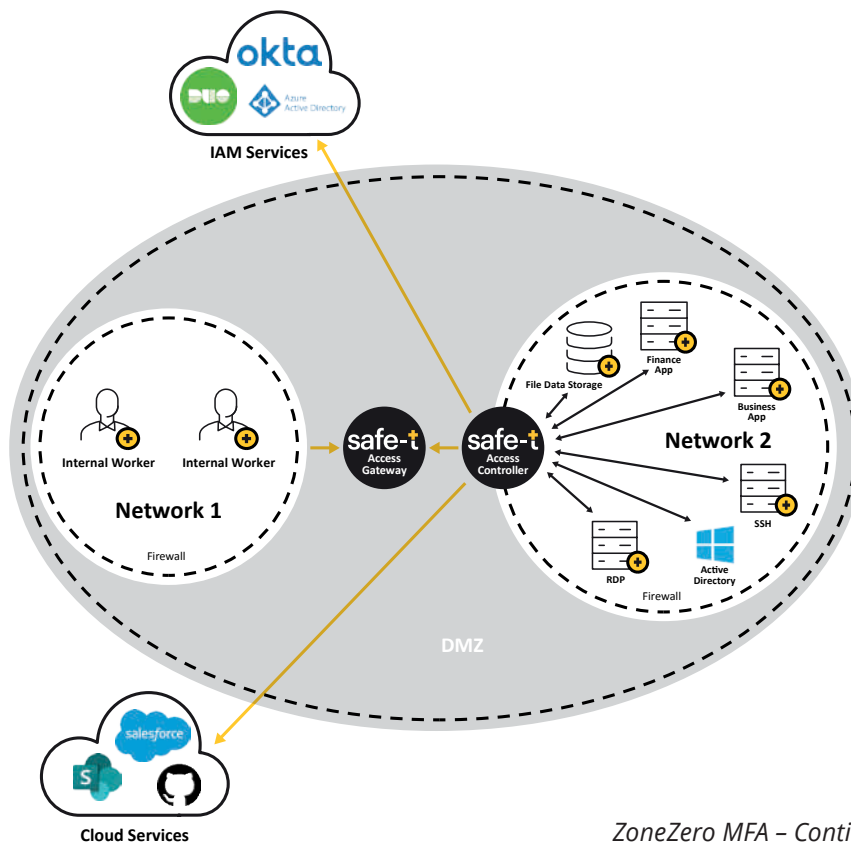

ZoneZero MFA – Continuous authentication
